OpenJarvis

UI Design & Interaction Specification

Dark navy interface • restrained electric-blue neon • clean ChatGPT-like chat • mobile-first layout

Purpose: Give a coding agent a durable visual and functional reference even when the user does not upload images again.

Important: The reference images are mockups, not a working application. Follow the written behavior requirements whenever generated-image text is unclear.

Design principles

• Use a clean ChatGPT-like layout with ample negative space and readable messages.

• Keep neon accents subtle: fine blue/cyan borders, focus states, and a restrained curve near the lower sidebar.

• Do not add random glow streaks, provider logos, social-media logos, or unrelated imagery to the main chat.

• Keep the app lightweight and responsive on low-memory Android devices.

Global navigation

• Home / Chat; New Chat; Chat History; Knowledge & Research; News & Fact Checking; Code Assistant; Browser Tools; Voice Settings; AI Provider Status; Settings.

• On mobile, collapse the sidebar into a drawer. Selecting an item opens the matching screen and closes the drawer.

• The composer stays at the bottom of the chat view; Stop cancels real speech/generation.

Security and honesty

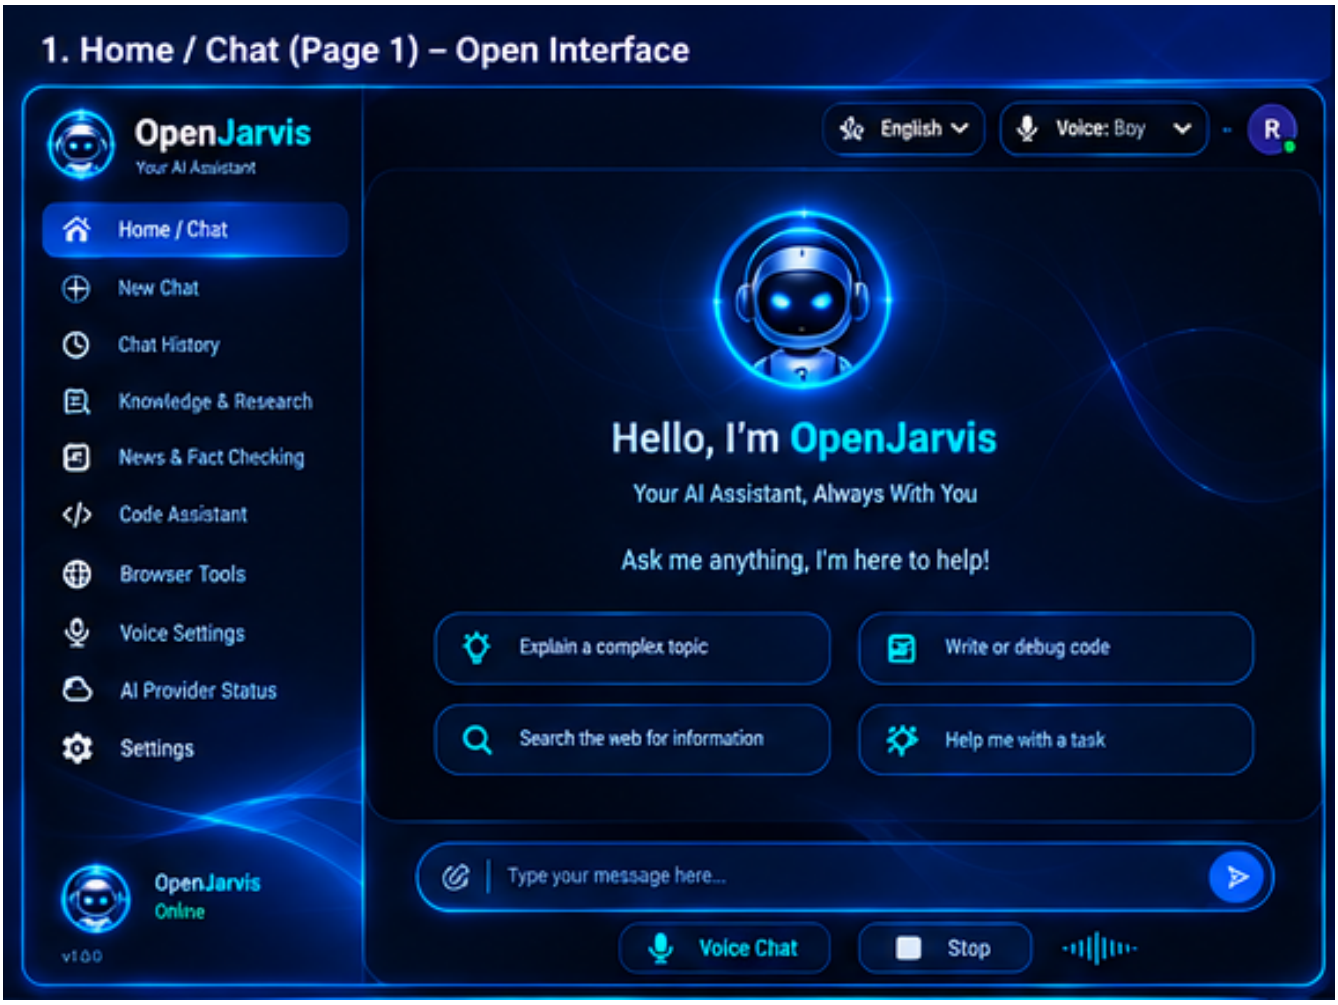

• Keep API keys server-side. Never put them in frontend files or localStorage.

• Do not fabricate provider status, news, citations, transcripts, progress, or test results.

• Research only accessible public content; do not bypass logins, CAPTCHAs, paywalls, or access controls.

• Validate server-side URLs and block private-network/localhost/metadata destinations.

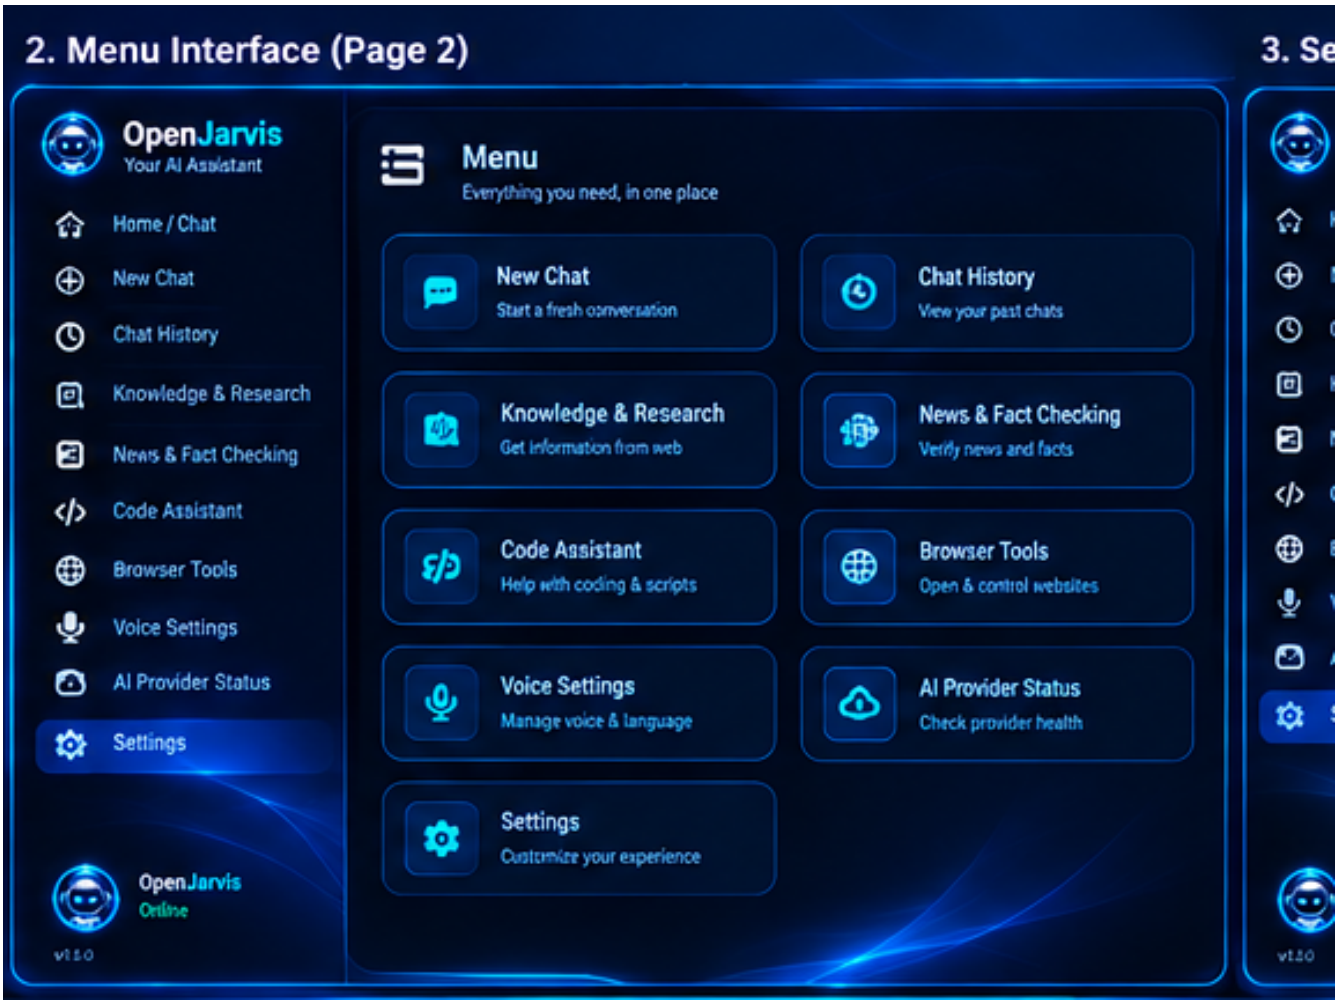

Page 1 — Home / Chat

Default OpenJarvis landing screen. Center the assistant avatar and greeting, keep four compact prompt suggestions, and anchor the message composer at the bottom. No provider logos or social-platform shortcut grid.

Interaction rule: every visible control must work, or be disabled with a clear explanation. The mockup alone is not proof of implementation.

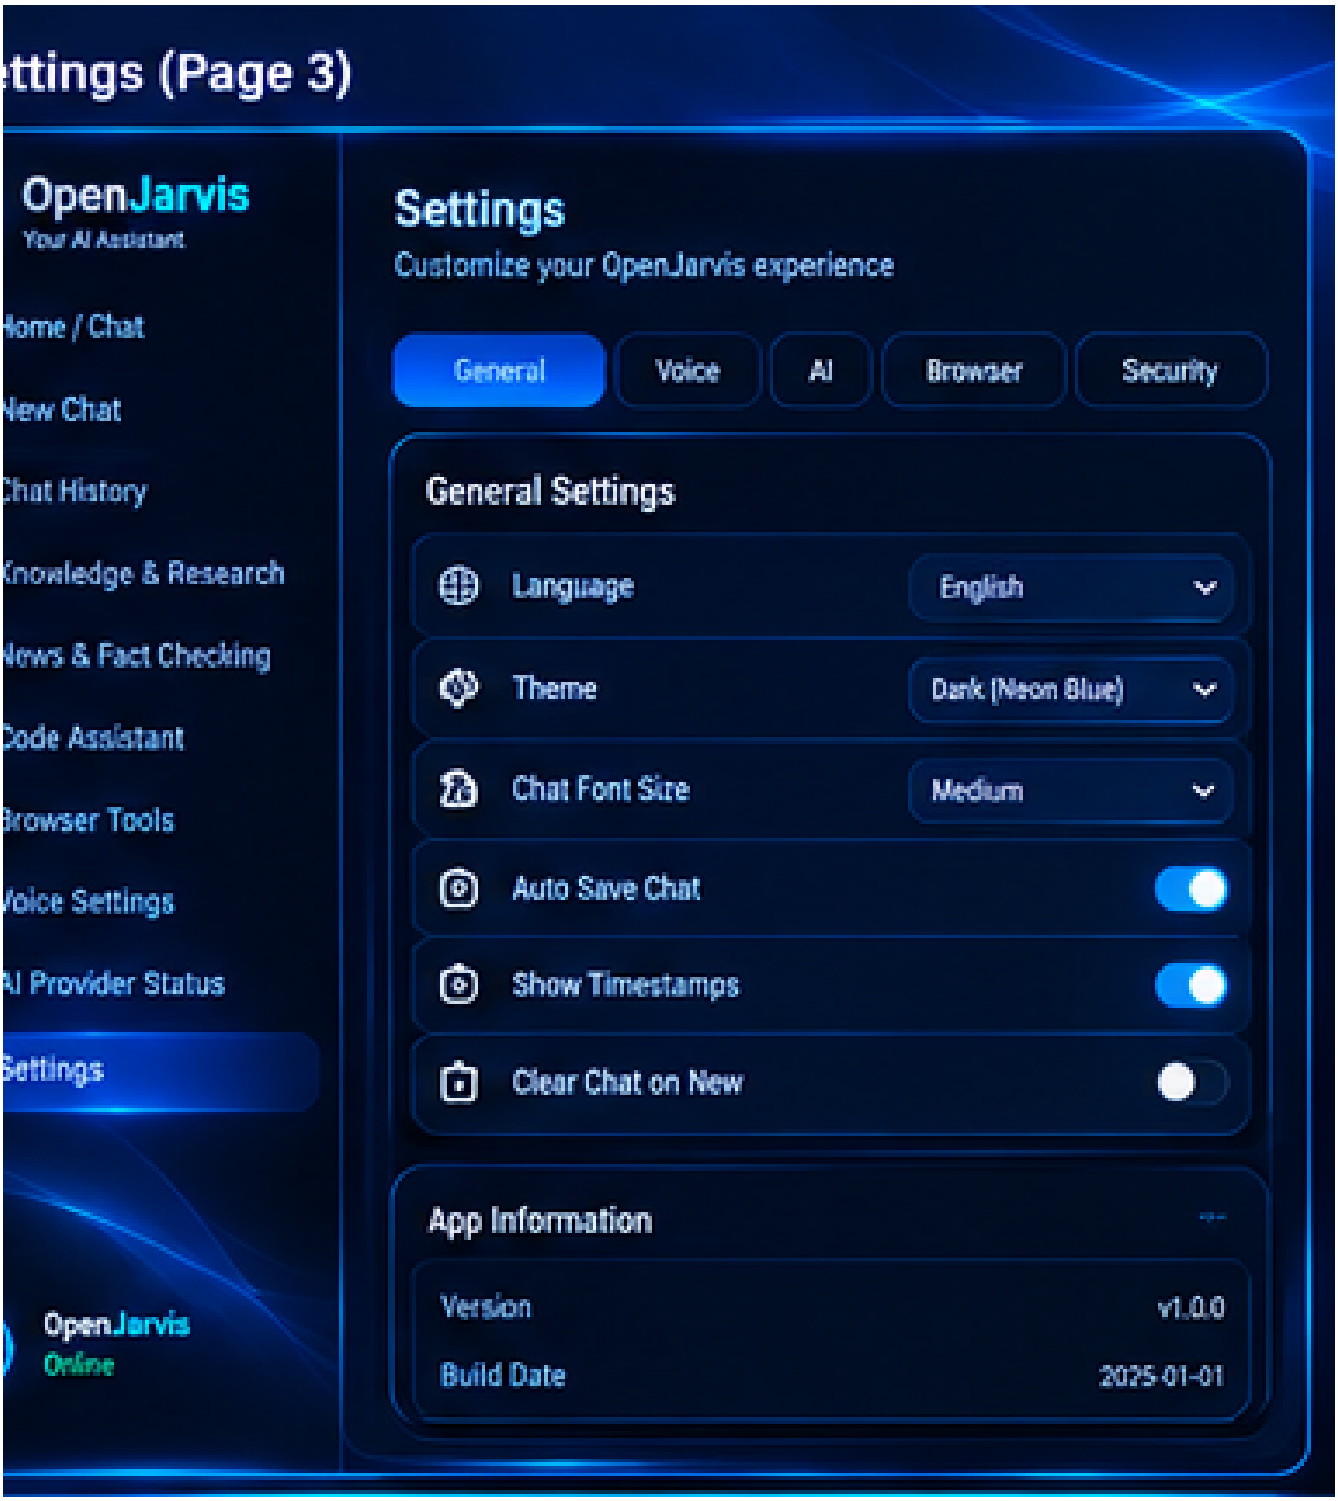

Page 2 — Menu

Navigation drawer/menu. Each item must route to the matching page. On phones, show a compact slide-in drawer with close behavior and an active item.

Interaction rule: every visible control must work, or be disabled with a clear explanation. The mockup alone is not proof of implementation.

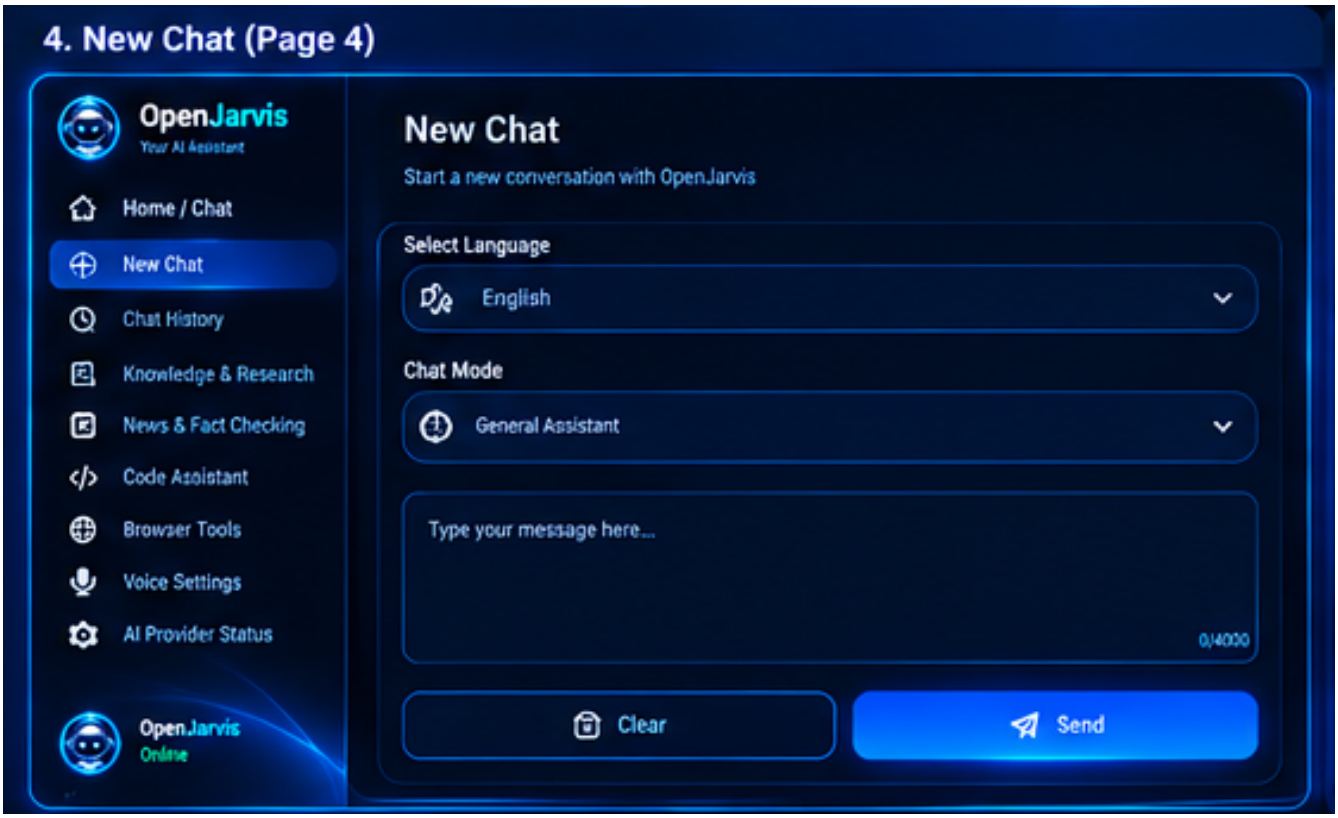

Page 3 — Settings

Grouped settings for General, Voice, AI, Browser, Security, and About. Save changes only when actually persisted; show clear success/error feedback.

Interaction rule: every visible control must work, or be disabled with a clear explanation. The mockup alone is not proof of implementation.

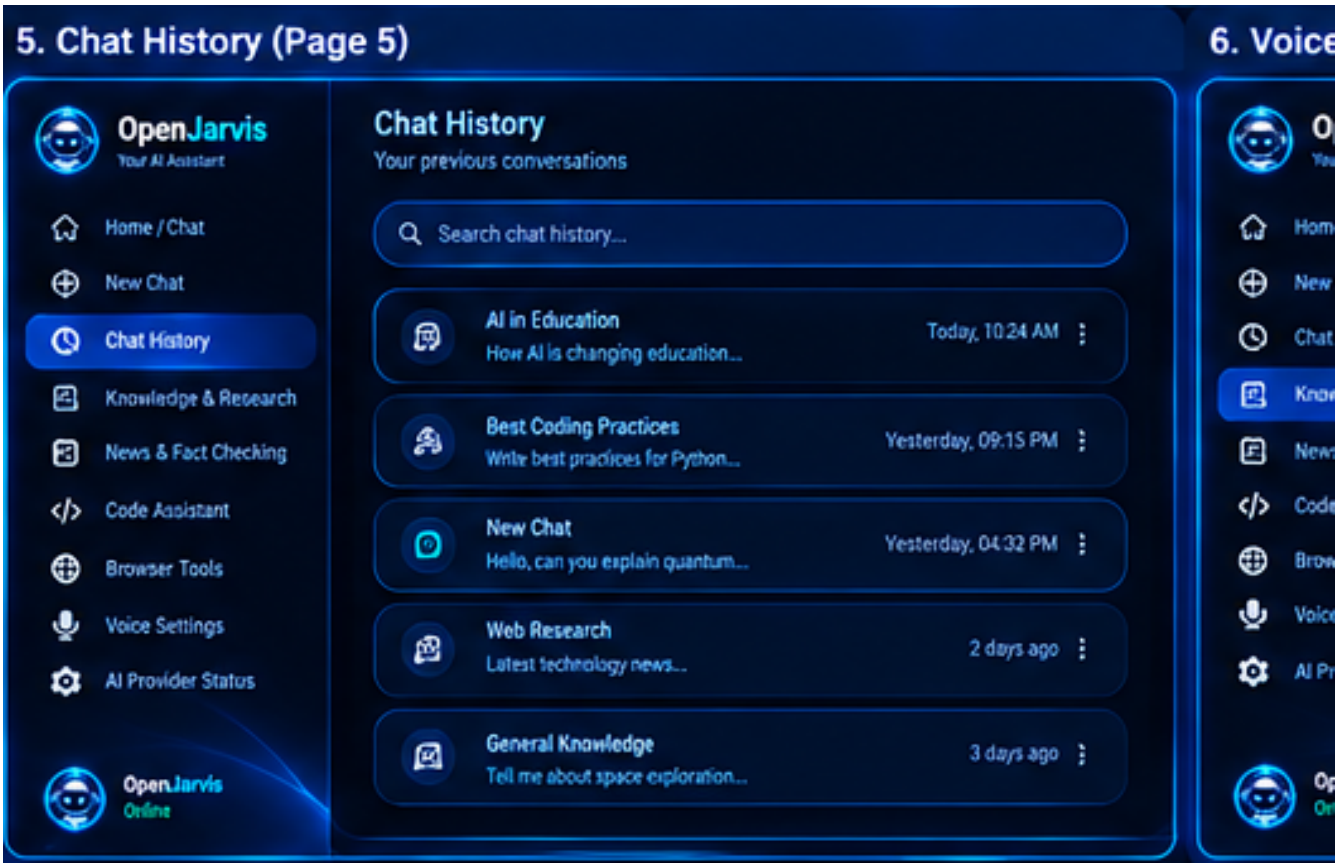

Page 4 — New Chat

Start a fresh conversation, optionally select language and chat mode, then enter a first message. Starting a new chat must not erase previous history.

Interaction rule: every visible control must work, or be disabled with a clear explanation. The mockup alone is not proof of implementation.

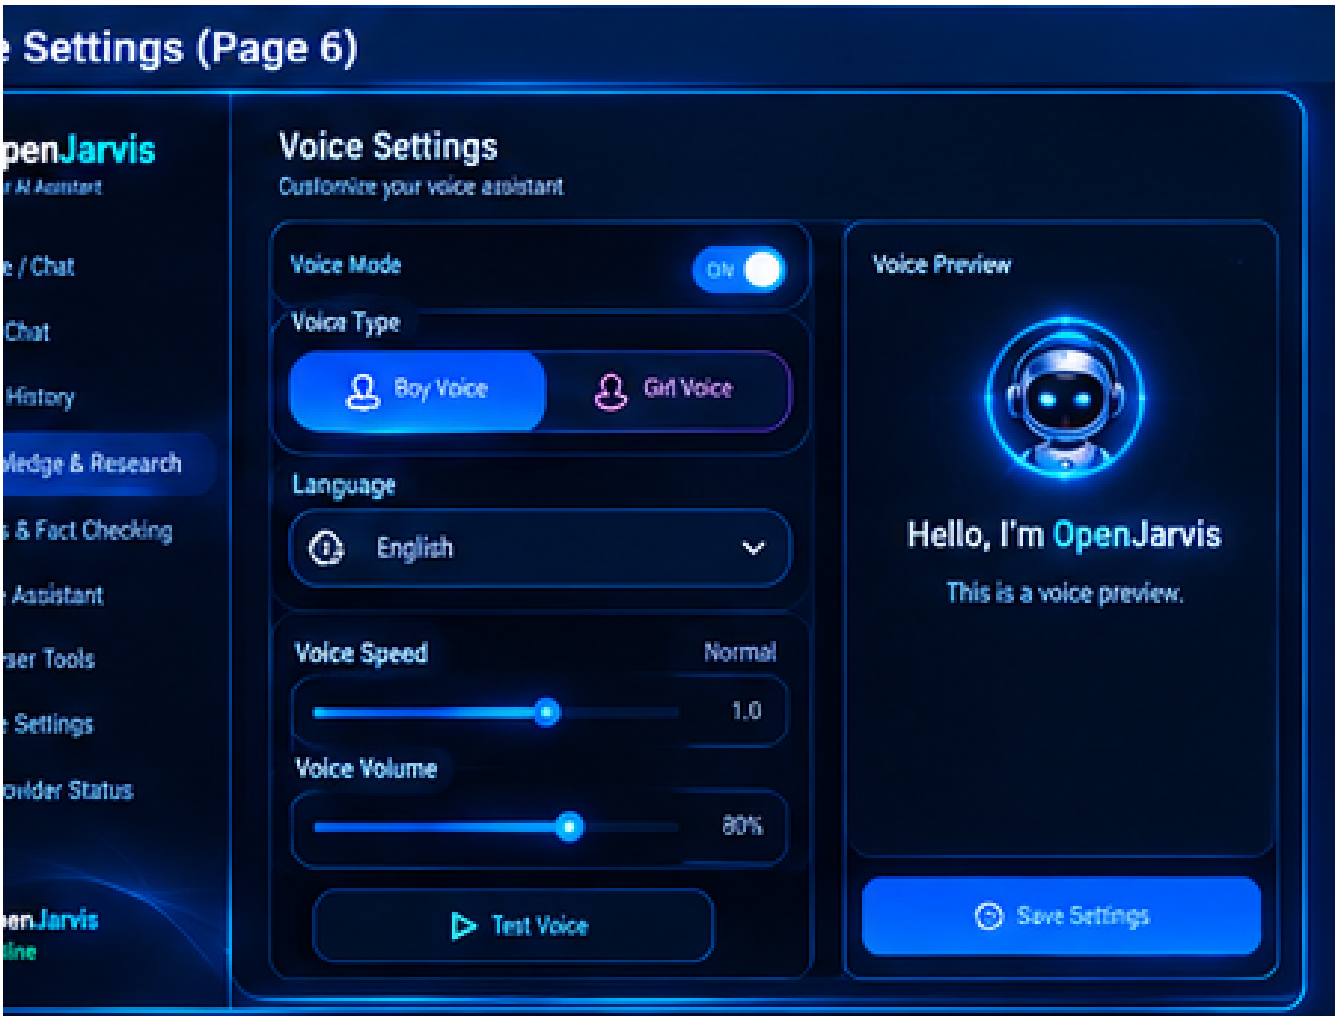

Page 5 — Chat History

Search and open saved conversations. Support rename/delete with confirmation, plus empty/loading/error states and an honest statement of where history is stored.

Interaction rule: every visible control must work, or be disabled with a clear explanation. The mockup alone is not proof of implementation.

Page 6 — Voice Settings

Voice mode, configured Boy/Girl voices, language, speed, volume, test voice, and Save Settings. Stop must cancel playback and prevent overlapping voices.

Interaction rule: every visible control must work, or be disabled with a clear explanation. The mockup alone is not proof of implementation.

Page 7 — Knowledge & Research

Search public and accessible information. Show filters, source cards, dates where available, excerpts, original links, and citations tied to real sources.

Interaction rule: every visible control must work, or be disabled with a clear explanation. The mockup alone is not proof of implementation.

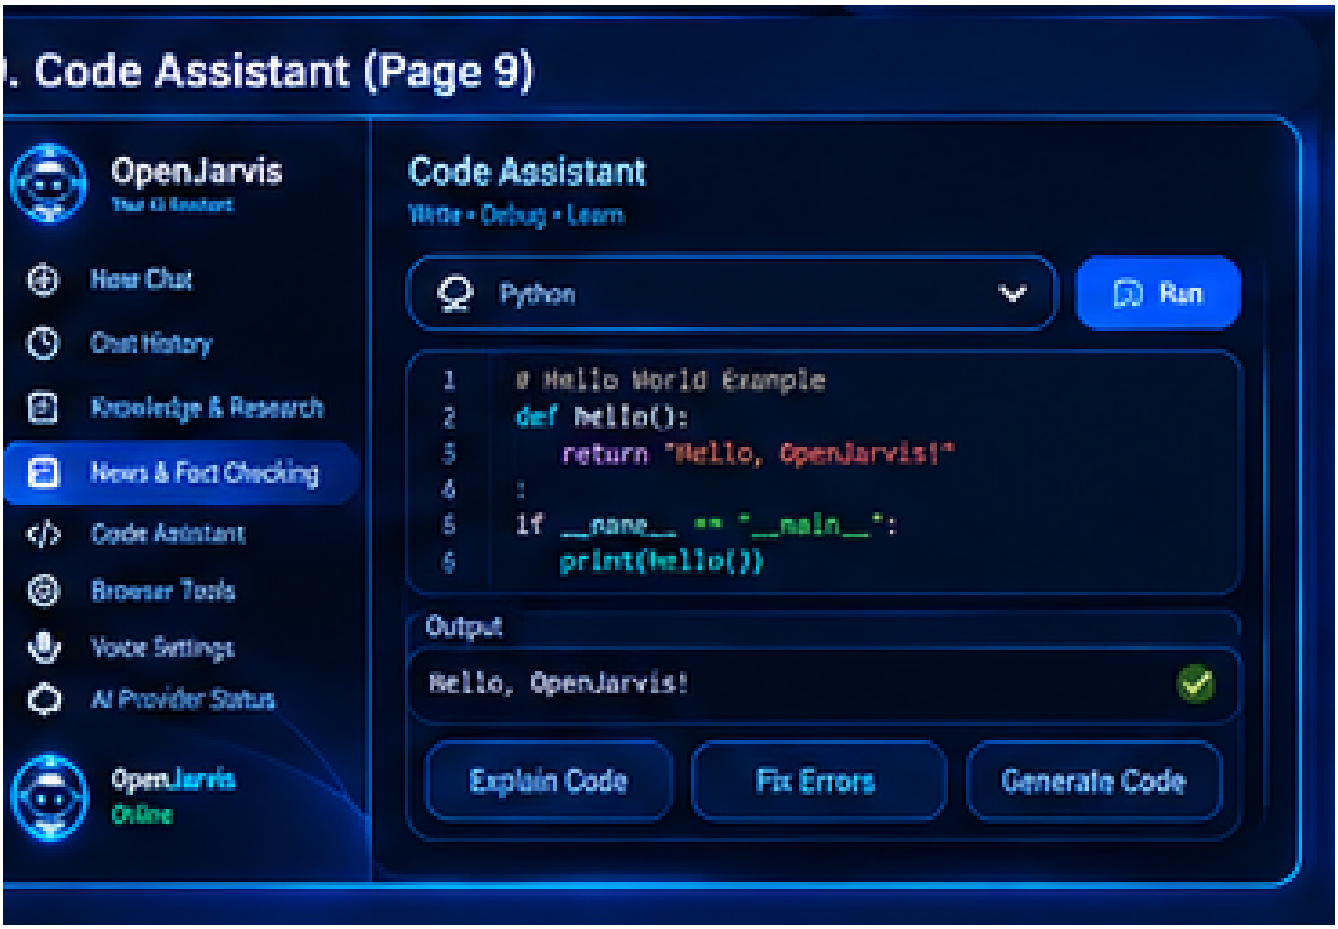

Page 8 — News & Fact Checking

Display sourced headlines and fact-check comparisons. Never fabricate live headlines; mark uncertain or conflicting claims clearly.

Interaction rule: every visible control must work, or be disabled with a clear explanation. The mockup alone is not proof of implementation.

Page 9 — Code Assistant

Code editor/workspace with language selector, explanation, error fixing, generation, and output. Run code only in a suitable safe runtime; distinguish actual tests from static review.

Interaction rule: every visible control must work, or be disabled with a clear explanation. The mockup alone is not proof of implementation.

Page 10 — Browser Tools

A safe URL/search interface for permitted public pages. Show page title and extracted public text. Block unsafe destinations and do not bypass access controls.

Interaction rule: every visible control must work, or be disabled with a clear explanation. The mockup alone is not proof of implementation.

Implementation acceptance checklist

- ■ Application branding remains OpenJarvis.
- ■ Home chat is clean, spacious, and ChatGPT-like.
- ■ Blue neon is restrained and intentional.
- ■ No third-party provider logos appear on the main chat screen.
- ■ All 10 page reference images are included separately.
- ■ Every navigation item opens the correct screen.
- ■ Voice state is real; Stop cancels playback/generation.
- ■ Chat history behavior and storage are documented.
- ■ Research citations point to real accessible sources.
- ■ API secrets are absent from frontend files and public archives.
- ■ Build/test results are reported honestly, including any missing credentials.

Deliverable note: This PDF and ZIP are the design/reference package. They do not claim the OpenJarvis backend or UI has already been implemented.
